Proposal

Breanna Mitchell, Megan Flinders, Cody Lambach

In our project, we are going to create a dashboard that will assist users in regards to fast food restaurants and their nutritional value. We will prepare datasets from Kaggle.com in a user-friendly space for easy data consumption. If someone is watching their cholesterol, a filter will show them what products to avoid. If someone is counting calories, another filter can show that information more prominently. We can even have dropdown selections of specific restaurants if someone is interested in one place in particular.
Data type and field of interest:
- Nutritional value of fast food chains

Questions to ask of data:
- Which restaurant has the highest/lowest nutritional value, fat content, sodium levels, etc.
- How do these restaurant's food options compare to one another?
- Is there an option provided at most restaurants that have similar nutritional values?

Sources of data
- https://www.kaggle.com/datasets/ulrikthygepedersen/fastfood-nutrition
